UOF - Outcome variant description

Some markets and outcomes have variable descriptions. This is for example the case for many outright markets and outcomes, as well as some dynamic markets – most importantly the correct score market, but also some cricket markets. These markets have a special specifier *variant* and this specifier is set in the odds_change message to a urn that looks like this: pre:markettext:1234.

To find the actual market name you need to do an additional API-call to descriptions/en/markets /<market>/variant/<urn>. The returned document will return the market name and where applicable, outcome names. Note that the same market can have different market descriptions at different times if the variant-specifier changes.

XML example

```
<market_descriptions response_code="OK">
    <market id="241" name="Exact games" variant="sr:exact_games:bestof:5"
>
        <outcomes>
            <outcome id="sr:exact_games:bestof:5:39" name="3"/>
            <outcome id="sr:exact_games:bestof:5:40" name="4"/>
            <outcome id="sr:exact_games:bestof:5:41" name="5"/>
        </outcomes>
    </market>
</market_descriptions>
```

Two markets with the same market ID, but with different *variant descriptions* should be treated as different market lines. This is the same way it works otherwise (i.e. market-id + specifiers uniquely identify a market line). Consequently, the Betradar system will handle and settle these market lines independently of each other.
