UOF - Bet settlement & bet clearing

As a general rule, Betradar sends out bet-settlement information for any market line that Betradar has provided odds for. Bet settlement information can be sent either live (as soon as the important event has happened) or after the match (when the results have been confirmed and finalized). This means the client system will typically receive two bet_settlement messages for the same event. The client system can see from the bet-settlement message what certainty-level the bet-settlement is in (live-scouted early bet-settlement) or confirmed (late bet_settlement)), and decide based on that information whether to act on the early or late bet-settlement information.

Note: *Live* bet settlement information is only provided for matches that Betradar covers live. Through the API using the schedule.xml or fixture.xml endpoints, you can find out whether a match is covered live or not.

The *liveodds* attribute indicates whether this match is booked by you for live coverage:

XML example

```
<sport_event liveodds="not_available"> Event is not available for you
<sport_event liveodds="booked">         Event is booked by you
<sport_event liveodds="bookable">       Event is bookable by you
<sport_event liveodds="buyable">        Event is buyable for you
```
