

# LO - Current request

Client systems can request an overview of the status of matches they are subscribed to. This happens by sending a current request. In this request the client system specifies what matches they want to get the status for.

**XML example**

```
<BookmakerStatus timestamp="0" bookmakerid="24" type="current">
  <Match matchid="661373" />
</BookmakerStatus>
```

*XML attributes definition*

Element	Attributes		
	Attribute	Description	Possible values
Bookmaker Status	type	Keyword which describes what kind of request is sent.	String "current" (for current requests)
	bookmakerid	The id of the bookmaker	Integer
	timestamp	The moment for which you want to retrieve the current status of the requested match(es). Using 0 as timestamp would normally represent the 1st of January 1970, but for the current status request it will automatically translate into current time.	UTC timestamp or 0
Match	matchid	The id of the match for which the current status is requested	Integer

After a current request is received the Betradar system will return the following messages:

- A message containing the odds, activation of odds and match status for the match requested
- A message indicating the current bet status. This is a regular bet status message
- All bet clearing messages sent before the timestamp given are sent as they were sent originally

All messages are separated by a newline. The replytype attribute is set to "current" for the reply messages from current requests. The match element will not include the msgnr attribute.
